Theres probably many more issues, but these are the ones I found noteworthy If I missed something or need to correct a statement, please dont hesitate to correct.

I do realize a good chunk of Mac users arent coders, but that doesnt mean coders wont have a huge number of obstacles too.. Sheepshaver does numerous ROM patches to avoid having to emulate the MMU (or most of the registers involved) at any cost.. Popularity aside, theres plenty of technical difficulties regarding Mac emulation.

The PowerPC CPU is rather complex, probably not as bad as a x86 CPU emulator, but definitely not trivial either. [T Shirt Design Tool Html5 Template](#)

On the other, you still have to deal with a pretty capable MMU Theres also the rest of the hardware, where crucial components like audio chips and hard drive controllers are seemingly proprietary.. It doesnt help that the best thing I found was in Apples own sources In general though, Apple doesnt really have much on its own old hardware.. Even not regarding legal issues, they are very different internally and are coded to work with specific hardware set-ups.. Re-implementing these ROMs is possible, but would a very laborious task and would require a ton of people to dig through and carefully document how these work.. Even for video, versions prior to 9 1 dont even have a OpenFirmware frame buffer video driver. [Download free weight conversion stones to kilos](#)

4 the generic CPU emulation runs well even on big-endian and 64 bit platforms A very fast CPU for x86 systems that translates PowerPC instructions into x86 instructions on-demand.. Macs themselves also are partially based on the PowerPC Reference Platform (PReP).. By caching these translations, a lot of speed is gained Using this CPU, the client will run about 15 times slower than the host.. If its any consolation, the video cards in most PPC Macs are pretty much the same NVidia and ATI cards seen in PCs.. Sufficient to make the client think that it has USB support Its ugly and contains a lot of hacks but it allows to boot Yaboot and BootX from HFS/HFS+ partitions.. On the one hand, this means that 32-bit PPC Macs can only address up to 4 GB, making it relatively feasible on 64-bit machines.. I love the novelty of being able to run OS 9 on my PC and be able to catch up on what I missed on back then, but its sad that no one has taken the trouble of continuing on what the others have started until recently..
